The Avian Demography Unit conducts the Coordinated Avifaunal Roadcounts in partnership with BircLife South Africa

# "In the end, aur society mill be defined not ouly by what we create, tut by what we rebuse to destray" <br> Jotu Sandhill, The Hature Conseruancy, USA. 

## General

When I wrote the last newsletter, there was hope, but no certainty of a 20th - but thankfully CAR is still running, against all odds financially, and still growing with 17 routes counted in Gauteng!

I certainly appreciated the speed with which most roadcount forms were returned. This was particularly helpful, as I was able to check forms during the many power cuts down here earlier this year. When I suggested candle light suppers in the last newsletter, I did not realise that these would be the only option at times down here!

The summer count was certainly the count most affected by inclement weather in the last 13 years. Counts in a number of precincts were postponed due to heavy rains. The province that was most affected was the Free State and Brian Colahan spent all day phoning to re-schedule counts for about 100 routes! A big thank you to Brian and all Free State participants for re-arranging their lives to count a week later. Some precincts in the northeastern Cape and Mpumalanga were also re-scheduled. It was unfortunately impossible to count most of the Wakkerstroom routes, as heavy rains ( 1240 mm in January and February!) caused extensive damage to roads and bridges. There must have been many muddy cars returning home! I am grateful for your perseverance in completing CAR routes, I know some people had to travel extra km to reach the other side of flooded rivers.

There was yet another increase in the number of Blue Cranes in the Overberg and Swartland (see trends on website, click on Blue Crane in the table at foot of the CAR webpage). The Swartland precinct began with ten routes in July 1996, ten years ago. I looked back to Circular 1 to see that 46 Blue Cranes were counted that July and the following statement was made 'It will be very interesting to see the pattern that emerges after a few years of monitoring'! I attended the South African Working Group workshop at Potberg in May and was glad to be able to present the crane trends in a number of precincts. You will find these on our website, as well as a map showing the extensive 'footprint' or rather 'tyre-tread' of CAR, those grid cells that have CAR routes.

I received a data request for species on a route in the Overberg from Andrew Jenkins. This route criss-crosses an area for a proposed powerline between Riversdale and Swellendam. The fact that habitat is recorded during counts, was very helpful in explaining the results. So I do encourage you to keep recording habitat for all species.

## Photographs of habitat

Thank you to those of you who have sent photographs of habitat along their routes. These will be particularly helpful in interpreting results and are a useful way of recording land use and changes in habitat. If you haven't sent photographs it is not too late! Please mark the date, route number and km (GPS coordinates too, if you have them) at which the photo was taken on the back of the photograph or if you send a digital photograph, do include these details in the file name e.g. OV15, $10 \mathrm{~km}, 29-07-2006$. This is optional!

## Date of winter CAR count

The date set for the winter count is Saturday, 29 July 2006. Start your count 1-2 hours after sunrise and make every effort to do the count on this specified date. If for some last-minute, unavoidable reason you are unable to count on this date, please let your Precinct Organiser know and do it on the nearest possible day. The summer count will be on Salurday, 27 January 2007.

## Count information

Thank you so much for remembering the new species codes for those birds that have had a name change. The same CAR 11 roadcount form, with the new species codes and a CAR leaflet are
enclosed. The leaflet is to hand out to farmers, who are sometimes justifiably concerned about strangers scanning their farmlands, or other interested people. Do read the Information Shects prior to the count and take them with you, as well as your route map. It is important to take other people with you on a count; it helps to have more cyes. Also if you ever can't do a count, someone else knows your route.

Do continue to count oribi in the Eastern Cape and Mpumalanga counts as well as KZN, while scanning for CAR birds. Record the km as usual, write 'oribi' in the species column and the number of individuals in a group.

Please send in your data by the middle of September, but always keep a copy yourself!

## Email addresses

I sent out an email to you all about the website report on the summer count and a number bounced back. If you didn't receive that email, do please send me your correct email address.

## Project material on the website

If you are missing any project material such as Information Sheets, or need extra CAR leaflets to hand out, these can be downloaded from a list at the foot of the CAR webpage. Project material is available in Afrikaans as well. The interim CAR summer count report is also here, with photos.

## Birds in Reserves Project database on website

Results from the Birds in Reserves project can now be accessed online. If you visit the website www.birds.sanbi.org you can get species lists for reserves, or reserves in which specics have been reported etc. at the click of a mouse!

It will be a much more complex process to develop queries and place the CAR data online, but this is the plan in the future.

## Updating the trends of all species

Amazingly it is now five years since the data used for the eight-year report was collected! We hope to put the updated trends for all species on the website by the end of this year. I am capturing the new routes, developed since 2001 ( about 170!), onto GIS so that we can calculate the GIS length of each route (we need the GIS length to calculate birds $/ 100 \mathrm{~km}$ ).

I have updated the trends for some precincts where we do have GIS lengths. These are already on the CAR webpage (click on the following species in the table at the foot of the CAR webpage: Blue Cranc, Grey Crowned Crane, Secretarybird, Denham's Bustard and White Stork).

## ADU observer numbers and mailing list

If those who assist you regularly would like to receive an ADU number and be on the mailing list, do include their name, title, initials and postal and email address details on a separate piece of paper.

## CAR Report

The eight-year CAR report is still available, the cost (including postage) is R150.

## CAR support

Many thanks to the Amajuba Wildlife Centre, the Newcastle Branch of WESSA, for their generous donation of R5000. The support of other individuals, listed below, is also much appreciated.

In the last newsletter I mentioned the possibility of funding through collaborative research. I am delighted that the South African Crane Working Group, together with the Zoological Socicty of London, have been

## Business and biodiversity

I recently attended the CAPE (Cape Action for People and the Environment) Conference, which focused on business and biodiversity. Businesses prioritising sustainable development gave presentations, amongst them many farmers.

Martin Hollands, of the Cambridge Centre for Conservation Policy, highlighted a change in attitude between business and conscrvation. Traditionally conservation happened in protected areas and business happened outside. But recently there has been the realisation that people and businesses depend on biodiversity. If biodiversity declines, then the ecosystem services provided by this diversity of interacting organisms and the environment flounder. Ecosystem services like clean air, water and fertile soil, regulation of climate, floods, disease and water purification no longer occur effectively and culturally our lives will be less rich. Businesses now need to turn to sustainable development, rather than short term gain. The businesses that are proving successful are those that are building in the cost of conserving biodiversity through environmentally friendly practices and management. The environment needs to be seen as part of the 'factory'. Society therefore needs to respond by supporting businesses that are operating sustainably.

The agricultural businesses represented at the conference highlighted the need for partnerships, the need to involve communities and improve livelihoods, to engage the power of the market. Independent Third Party Endorsement of sustainability, limited ecosystem impact and effective management is very valuable. Environmental certification is a 'gateway' to a crowded market. The consumer today is more concerned about ethics and purchasing to make a difference. Some businesses have been able to find a niche in the market for their products by exposing the consumer to the story of the product and the people and environment in which it is produced sustainably. But the point was also made that consumers won't compromise on quality and value. I was struck by a statement, made originally by Professor Samways of the University of Stellenbosch, that "the battle for biodiversity will be won or lost on agricultural lands.' Especially as we live in a country ranked the third most diverse in the world where $80 \%$ of our land is farmland.

Brett Myrdal, of the Table Mountain National Park, a World Heritage Site, also pointed out that we need to look at who gains from growth in eco-tourism. Where possible, development should only occur on areas that
have been previously developed and social upliftment is most important.
Valli Moosa, Chairperson of the IUCN and former Minister of Environmental Affairs and Tourism, highlighted the phenomenal population growth in the last 50 years and the incredible pace of development. In the year 2000 the economy grew more than it did between 1800 and 1900. Global insecurity of oil is a huge challenge that has focused us on the environment. The time has come for a 'step-change', for payment for ecosystem services and payment by those who benefit from conservation of the environment.

In the 12th Annual Vision, published by Endangered Wildlife Trust and subtitled 'Business, Ecotourism and the Environment', Karin Ireton gives an encouraging review on how far South African businesses have come in conserving the environment. But she points out that if this progress is to continue then we need two things to cause a further "stepchange'. There must be 'market reward for imovation, efficiency and finding new directions. Reward from consumers, communities and authorities. If consumers aren't really interested in more sustainable products and lifestyles, the market signals won't reinforce company bchaviour'. Secondly, there needs to be an ongoing programme to ensure that understanding of sustainable development stretches to even the smallest emerging business. 'Much of our economic growth will happen at small and medium-sized business level.'

A sobering thought is that providing adequate food, clean water and basic education for the world's poorest could all be achieved for less than people spend annually on makeup, ice cream and pet food! The linking of job creation and poverty relief to restoring biodiversity in degraded natural areas is something that has not been done on this scale anywhere else in the world (e.g. Working for Water, Working for Wetlands). South Africa has received international recognition for this innovation.

One presenter at the 'Fynbos Fynmense' part of the conference ended by saying that a visitor to their wild flower harvesting farm remarked that this was 'God's garden'. We each can play a role in nurturing this 'garden', whichever part of it we live in - especially by reducing, re-using and recycling - living sustainably in whatever way we can. As consumers we can choose products that have been produced in an environmentally friendly way.

awarded a Darwin Initiative grant for three years for a project entitled Integrating Crane Conservation with Sustainable Habitat Utilisation. CAR will receive some of this funding in return for access to the CAR crane data. As this will only be about a sixth of our budget, we are still in urgent need of funding. I am waiting to hear whether other submitted proposals are accepted. Thank you to those who have written artieles about CAR. Yvonne Craig has continued to increase awareness of our large birds in Our Times, a local newspaper. Ken and Gertie Griffith's wrote a report about the Border counts in Tiptol. Barbi Forsyth described the Chrissiesmeer counts in their Bird Club newsletter, Bokmakerie and an article about CAR was included in KZN Birds.

Some of you may have seen the very brief snippet about CAR on 50/50 after the summer count. Thank you to Belinda Shaw, who applied for funding for this from 50/50. Belinda and her husband interviewed me and filmed part of a CAR count, but then had to edit it to two minutes! I was just sorry that more detail could not be included, but hopefully it did increase awareness of the project, these special birds and you special people!

## Thank you for your donations!

Jean Spearpoint, John Carter and OV05 team, Fred Leask, Inćs and Duncan Cooke.

## Ringed birds

Ringed cranes were seen on OV04 and OV18. Do look out for colourringed cranes or other species all through the year and report details to SAFRING. For details, see the ADU website.

Pat Lowry reported the ring details of a White Stork found dead on a farm near Kokstad. This stork was 8536 km from where it was ringed in June 1999 near Puska, Croatia! Whenever you find a dead bird, do check for rings.

## Ground Hornbill Working Group

Southern Ground Hornbills were not recorded on any of the CAR routes this last summer. John Broodryk, chairperson of BirdLife Lowveld, is investigating the possibility of CAR routes in the Kruger to cover savannah habitat. If you have friends in other parts of the savannah biome, do ask them to get in touch with me as I am keen to establish routes to monitor all the large birds.

As mentioned in the previous newsletter, do send in any sightings at any time of year. LD van Essen writes a regular newsletter, see their website www.ewt.org.za.

Alan Kemp, who has spent many years studying the Southern Ground Hornbill, sent this report at the end of last year:
'The 4th International Hornbill Conference, held in South Africa went well, with about 85 delegates from 20 countries. While no African species appear endangered, the warning lights are on with declines reported for many species and arcas. Asia is much worse off, given the extensive loss of forest habitats, intense population pressures (human), and the fragmentary nature of the forests and/or lands on which they still exist. For this reason the Asians are way ahead with innovative conservation activities, and we can lcarn much from their experiences and reactions.
'Our KZN workshop involved a week of intense interaction with private landowners, conservancies and official conservationists. Workshops were presented on how to age, sex and find nests of SGHs, linked wherever possible to field excursions to visit known habitats and nest sites. Our initial impression was of extensive areas of transformed land (mainly sugar and wood plantations, and residential development), with patches of good habitat remaining for SGHs in between or adjacent to these barren areas. All reported nests were sited in cliff holes, contrary to the mainly tree nesting habits of Limpopo SGHs. Of most concern is the apparent decline and/or disappearance of reports from northern KZN , definite in the Pongola-Itala Paulpietersburg area and probable in the Mkuzi-Umfolozi--Hluluwe area, that link to the disappearance from Swaziland and southern Mpumalanga
a possible rift between the northern and southern range of the species in South Africa.'

## Thank you!

Thank you so much for counting, despite muddy roads in some areas. Deep thanks to Precinct Organisers, a number of whom had to re-schedule counts. Linda Tsipa has continued capturing all the data over many hours and saved me time editing the tables. Marja Wren-Sargent has typeset this newsletter in record time.

I wish you safc travelling: take care when stopping to count every 2 km , and I hope it won't be too freezing a winter count.

Donella Young, Project Coordinator

## Results

In the tables, threc numbers may appear, e.g., 15/5/2 $=15$ adults, 5 juveniles and 2 chicks; or two numbers, e.g., $20 / / 1=20$ adults, no juveniles and 1 chick; or one number, e.g., 13/ $/=13$ adults, no juveniles or chicks. The following abbreviations apply:

Korhaans: Blue $=U K$
Karoo $=K K$
White-bellied = WBK
Black-bellied = BBK
Southern Black/Black $=$ SBK
Northern Black/Whitequilled $=$ NBK

Storks: Black $=$ BS
White $=$ WS
Abdim's $=$ AS
Yellow-billed $=\mathrm{YS}$

Bustards: Kori $=\mathrm{KB}$
Ludwig's = LB
Denham's/Stanley's $=\mathrm{DB}$

Cranes: Blue $=\mathrm{BC}$
Grey Crowned $=\mathrm{CC}$
Wattled Crane $=W C$

Southern Ground-Hornbill $=\mathrm{GH}$
Southern Bald $\mathrm{Ibis}=\mathrm{BI}$
Spur-winged Goose $=$ SG
Secretarybird = SEC
Black-headed Heron = BHH
Black Harrier $=$ HAR
oribi $=$ OR

## Mistakes and misprints - help us find them!

Please check the figures given for your route in this newsletter against your records, and report any discrepancies. David Gaynor did find an error, so do check carcfully!

## Karoo, Northern Cape

Mark D. Anderson, Ornithologist, Department of Tourism, Environment \& Conservation, Northern Cape reports:
'On 28 January 2006, 22 people counted large terrestrial birds along thirty nine 20 km routes in the Northern Cape's castern Karoo, as part of the 22 nd Karoo Large Terrestrial Bird Survey. Fewer peoplc participated than during other recent surveys, which is unfortunate. A challenge for the organizers of CAR and especially the different precincts will be to keep the participants interested and motivated. It is only over the long-term that the project will provide useful data, so it is going to be a challenge to keep the participants enthusiastic during the coming years.
'During the recent survey, 923 large terrestrial birds were counted ( 118.5 birds per 100 km ). These were mainly Northern Black Korhaans ( 325 birds), Spur-winged Gecse (344 birds) and Blue Cranes ( 144 birds). Northern Black Korhaans are particularly common in some areas and there is concern that the counting of these birds may distract the observer from observing and counting more important species, such as Ludwig's Bustards. Five Blackheaded Herons and a remarkable 344 Spur-winged Geese were counted, species that are not always common in the Karoo. With the high rainfall and the inundation of many ephemeral wetlands, there was an influx of waterbirds into the eastern Karoo. Eleven Blue Crane chicks were counted, a lower number than during many of the previous summer's surveys. It is apparent that the cranes bred later during the 2005/6 summer, which was especially evident during the February 2006 ringing trip when several small chicks and still incubating adults were observed. During the ringing trip, in collaboration with the South African Crane Working Group, 49 Blue Crane chicks were caught and ringed, bringing the total number of birds ringed since 1997 in the Northern Cape's eastern Karoo to 369 individuals.’

Congratulations to Mark, who has just published a book on the birds of the Orange River and surrounding area. Thank you to Mark and Ronelle for their time and effort in coordinating these routes.

## Mpumalanga

A reminder that there has been a request from the Oribi Working Group to include Oribi in your counts, while scanning for CAR birds. As it was only possible to count a few Wakkerstroom routes, the densities of Blue Korhaan, Grey Crowned Crane and Southern Bald Ibis were lower than they have been for a while for this province.

## Steenkampsberg precinct

In this precinct the numbers were generally above avcrage for a summer count. There was only one sighting of White Stork. Hendrik van Wyk recorded five Denham's Bustard on MS06, this is the highest total for 17 counts. On MS07 Bryan and Alice Rowland spotted one Wattled Crane. Of special interest were two Oribi sightings, cach with three animals, including two juveniles.

Do continue to count Helmeted Guineafowl on these routes, using the abbreviation HG, and also fill in activity and location (i.e., the last three columns) for Southern Bald Ibis, as well as for cranes and bustards.

The rather 'drowned' habitat at 51 km on MC04! Photo by Claire Eksteen.

## Middelburg precinct

I was glad to receive a count from Brian and Margaret Taylor. Unfortunately Pieter du Plessis is no longer able to coordinate these routes; thank you for your interest, Pieter.

Beaufort West precinct
Maria Andela was only able to count half her route as a very muddy riverbed prevented further travel. Stefan Theron, who counts WB03, remarked that although the veld was green, they saw a disappointing number of birds and that this was probably due to dispersal of birds because of the widespread rains.

## Little Karoo precinct

I haven't received the results yet.

## Uniondale precinct

In this precinct White Storks were only present on two routes and Mike Euston-Brown expressed surprise that they didn't have any, especially after counting over 850 a few years ago. But they did record their first Ludwig's Bustard on WU05

Natalie Baker, who coordinates these routes, highlighted the need to be careful in identifying Denham's and Ludwig's Bustard, as both species occur in this area. Information Sheet No. 3 focuses on distinguishing between these large bustards and is available at the foot of the CAR webpage, or contact me.

Margaret Kiely is the new route leader for the route along the Old Cape Road which was recced last July. Their count was more productive this summer and they recorded 39 White Storks.

Welcome to more of The Lakes Bird Club members who are helping in these counts.

## Calitzdorp precinct

George Hattingh saw 9 Denham's Bustards on WC01 and the number of Blue Cranes on the new route, WC02 is encouraging.

## Overberg precinct

A number of participants remarked on the dry conditions and that most dams were empty. Despite the very dry conditions, the density of Blue Cranes in the Overberg is still on the increase. There is concern that the Blue Cranes are competing with livestock for food at feeding troughs. The Overberg Crane Group is investigating the extent of loss to farmers.

John Coats and the Aucamp's recorded seven species, including two Southern Black Korhaans and 11 Karoo Korhaans. White Stork numbers were low, but this is not surprising given the dry conditions and good rains further north. Keith and Michelle Moodie saw the highest total of White Storks (169) and Black-hcaded Herons (25) on OV08. Gerald Swanepoel and Vicki Hudson saw 15 Denham's Bustard on OV24 and a Black Stork. Unfortunately Vicki is no longer the Overberg Field Worker, but we do wish her well in her new position in Cape Nature and will keep in touch. Mick D'Alton, who counts a CAR route regularly is now Chairperson of the Overberg Cranc Group and a new field worker will be appointed soon. I would like to acknowledge the outstanding work that Wicus Leeuwner has done over many years as Chairperson. Some Overberg participants gathered at the beautiful spot on the river on his farm after the count and I was glad of the opportunity to see you.

Héyne Brink and Andrew Jenkins ringed 4 Black Harrier chicks from one nest on 29 November. Héyne had spotted nesting activity.

## Eastern Cape

A reminder that there has been a request from the Oribi Working Group to include Oribi in your counts, while scanning for CAR birds.

In the Border precinct there were again no Black-headed Herons in the usually thriving heronry in the Witch's Krantz near Berlin. On EB03 P. Swift and Ian Field recorded 28 Grey Crowned Cranes.

In the northeastern Cape most counts were re-scheduled due to rain on the CAR day. Mike Agenbag counted 15 Southern Bald Ibis on EE11. Les and Adrian Larter saw seven different species on their route, EE17. As usual EE19 had the highest number of Blue Korhaan. Fred Leask, who counts EE20 noted that many pine trees had been planted along his route having a definite impact on bird life. He also remarked that Working for Water were doing wonderful rchabilitation work on wetlands. The last sec-
tion of EE09 is no longer passable as the road is not maintained; as this section was more than $10 \%$ of the route this route has been re-numbered EE21.

Bo Bonnevie saw seven different species on his route EG03, including 298 White Stork. In the Humansdorp precinct there was a noticeable drop in numbers from the last few summers, probably due to extensive fires in the area in November last year followed by a dry scason. A strong wind on the Humansdorp plains during the count probably also affected numbers. There was not a single heron, or spoonbill at the heronry on EH06. This is the first time in any trip to that area in 10 years that this heronry has been empty. Thank you to Brent and Chantelle Cook, who provide a landrover for counting this route as part of their contribution to conservation. They run Thula Moya Nature reserve and The Dunes Guest Farm and Desmond

Ponti, one of the game rangers, drives and participates in the count. Wendy Rosser and her team recorded 363 White Storks on EH03.

On routes EP06 and EP09 in the Fish River Valley, there has been a significant change in crops again, due to the low mealic price. Last year there was about $70 / 30$ maize, but this year 70/30 lucerne. Due to good rains the area was lush and the lucerne almost high enough to conceal storks! Ken and Jen Munro recorded high numbers, as in previous years when lucerne predominated; 1077 White Stork on EP06 and 564 on EP09.

Thank you to Fin Wcakley, who has coordinated the Queenstown routes since their inception in July 1998. Gail McCann now coordinates these routes. Gail and Kate Webster did a recce for a new route.

Braam Basson saw six different species on his route ES02 including a Kori Bustard, five Secretarybirds and eight Karoo Korhaans. We have decided not to continue the route recced by Pat Palmer in July last year. Black Storks were rccorded on four Eastern Cape routes. No oribi were observed.

"Douglas! Your shoulders aren't hunched!'

## Free State

Brian D. Colahan, Principal Nature Conservation Scientist: Ornithology, Frec State Tourism, Environment \& Economic Affairs, reports:
'Reports on the morning of Friday 27 th, of gravel roads which had been damaged by the recent heavy rains in the Free State, such that certain routes would not be accessible by car the next day, led to the surveys in all three precincts being postponed until the following Saturday. Despite this very inconvenient last-minute hitch, most CAR leaders were able to re-schedule. Over 107 routes (some results have yet to reach me) were surveyed (a few of them not completely, because of flooded sections) and 7013 km were covered, yiclding 7083 birds. In the Northeastern Precinct (FN), 23 routes ( $1464 \mathrm{~km}, 1365$ birds and 93.2 birds $/ 100 \mathrm{~km}$ ) were done, $20(1269 \mathrm{~km}, 829$ birds and 65.3 birds $/ 100 \mathrm{~km}$ ) in the Northwestern (FW) and $64(4280 \mathrm{~km}, 4889$ birds and 114.2 birds $/ 100 \mathrm{~km}$ ) in the Southern (FS). The overall density of $101.0 \mathrm{birds} / 100 \mathrm{~km}$ was less than that for the 2005 summer survey $(114.6 / 100 \mathrm{~km})$, when there were far more White Storks (733 and 2528, respectively).
'The Bald Ibis was the most abundant species recorded in FN ( $472,32.2 / 100 \mathrm{~km}$ ), followed by White Stork ( $275,18.8 / 100 \mathrm{~km}$ ); however, not one Abdim's Stork was seen. The 19 Denham's Bustard (along three routes, nine of them by Pietré Enslin's team on FN57), is by far the most ever seen in that precinct. The 140 Blue Cranes recorded ( 121 of them seen along FN52, by Martin \& Melanie Potgieter) gave this precinct a density of $9.6 / 100 \mathrm{~km}$, higher than that for FS $(8.5 / 100 \mathrm{~km})$.
'Both the migrant storks were recorded in FW, but all ( 72 White Storks and 55 Abdim's) were along FW36, surveyed by Johan Hardy's team. The most abundant species here was, as usual, the

Northern Black Korhaan (42.5/ 100 km ), as it was in FS, but where the density for that species was the highest ever recorded there: 63.8/ 100 km ! There were 23 routes with 50 or more of these birds, and Christo de Meyers's 170 along FS43 kept him busy for 6 hours. However, Fanie \& Stefanus Buys (FS56) saw the most birds out of all the routes 576 (including 264 Abdim's Storks, 154 White Storks, and 121 Northern Black Korhaans), or 8 birds $/ \mathrm{km}$. A Kori Bustard was seen on cach of two adjacent routes (and was therefore possibly the same bird), on FS54 (Janine Lieffrig \& Elsa Beemstebocr) and FS55 (Johan du Preez). On FS27, Erika Schulze \& Brenda Weyer saw the only White-bellied Korhaans, a group of four.'

Many thanks to Brian Colahan, particularly for all the phoning about re-scheduling.

## Gauteng

CAR has forged ahead in Gauteng where 17 routes were counted!

Craig Whittington-Joncs, of Gauteng Nature Conservation, has been most efficient in setting up and organising the counting of so many new routes, with the help of Sean West. The routes have been grouped into six precincts. The large terrestrial bird species diversity is low in this province with mostly Northern Black Korhaan, Black-headed Heron, Helmeted Guineafowt and Spur-winged Goose being recorded. Habitat transformation has been extensive, so it is very important to keep track of bird numbers in this province. Rouxdene Deysel saw two Yellowbilled Storks on their route in the Devon area. Six White Storks were seen on GH02. A single Blue Crane was recorded in this province, on a route near the World Heritage Site, Cradle of Humankind.

Thank you to Craig and Sean for the many hours involved in starting up CAR in Gauteng.

## 

"Lots of new faces, this year!"

## KwaZulu-Natal

As mentioned in the last newsletter, some gamebirds have had their names changed, so do refer to the list below while doing your count for the new abbreviations

Visibility was restricted in KwaZulu-Natal by very tall grass and maize following a very wet summer. The Blue Crane numbers were higher than usual, Mark Meter recorded three large flocks (in total 141 birds) on his route, KG08, near Cedarville. Mark has counted this route since it began in July 1997 and has retired to Pictermaritzburg, he hopes to assist in the Midlands counts. In the East Griqualand precinct Bob and Judi Williams saw a pair of Grey Crowned Crane parents with three big chicks! They were able to confirm with the farmer that they were from the same parents, when checking on them at a later stage. Two Goliath Herons were seen on Kobus Nel's route, KG07, as well as 187 Grey Crowned Cranes. Ed and Myra Wells saw a Woolly-nceked Stork on KG10. It was encouraging to sce that there were many more Wattled Cranes (23) back on Pat and Bruce Whittle's route on the Dorning's farm.

Ken Gordon also recorded Wattled Cranes (2) on his route KL01 Rodney Dicks noted that his route, KL02 had changed in character, as most farmers now planted soya beans and not maize, he had a disappointing and very muddy count! In the Dundee precinct Heino Wellmann recorded two White-bellied Korhaans and a Marabou Stork on KD01. Tony and Val Cross saw 31 Southern Bald Ibis on KD02, as did Johan and Christine de Villiers on KN01. Johan and Christine remarked on the number of pans in the veld after excellent rains, attracting many waterbirds.

Alan and Bernadine Turner saw a Red-necked Spurfowl on their route, KM05. Carol Horne recorded 247 White Storks on KU02, the highest total in KZN. Chris Thomas remarked on the unusual sighting of European

Roller on both Underberg routes, Shirlcy Bennett and Evelyn Hughes also saw one on their Midlands route, KM01. No Southern Ground Hornbills were recorded in KZN on the CAR day, but Gavin Calverley saw three on his farm near Melmoth the day before the count.

Fewer oribi were recorded than usual, but their numbers would also have been affected by the tall, lush vegetation reducing visibility.

Do continue to count Oribi and use the following abbreviations for gamebirds: HG for Helmeted Guineafowl, CF for Crested Francolin, SS for Swainson's Spurfowl, NS for Natal Spurfowl, RNS for Red-nccked Spurfowl, RWF for Red-winged Francolin, GWF for Grey-winged Francolin and SHF for Shellcy's Francolin.

Thank you to Tim Wood for keeping an eye on CAR in $K Z N$.
